Class Description

Many drinking water systems throughout Maine must contend with iron and manganese that occurs in their water source – which can cause many aesthetic and water quality issues for your customers.

Join MWUA and Air & Water Quality Inc as we explore everything from the reasons why iron and manganese must be removed from drinking water to the various options for removal. The day will start with a presentation and will conclude with a tour of the North Berwick Water District Treatment Facility.

Since making sure your customers are happy with the drinking water you serve is always a priority, this is definitely a presentation you don't want to miss!
